

Recover unbooked leads with assisted demo scheduling

Nimish Goel | BrightChamps AI Forward Deployed Associate take-home | 30 September 2026

Decision

Within two weeks, pilot a coordinator-owned daily list of leads still unbooked 24 hours after signup. Before contact, verify the live booking, contact, and opt-out records. Ask if the parent still wants a demo, offer two currently available times suited to the child and timezone, and record the response. Use existing CRM exports, calling/WhatsApp, and booking tools; no engineering sprint. The accompanying HTML is a fictional-data workflow prototype, not a live messaging or booking integration.

Leak and rupee working

Of 5,000 leads created in June-July 2026, 1,771 (35.42%) have no recorded demo schedule. This is the largest single stalled group by allocated acquisition spend, compared with 1,424 completed-but-unconverted, 1,169 scheduled-but-not-joined, and 274 joined-but-not-completed leads. **$1,771 \div 2 \text{ acquisition months} \times ₹900 \text{ per lead} = ₹7,96,950 \text{ per average month}$** . This is marketing spend already incurred, not proven lost revenue or recoverable cash.

For scale only, an unvalidated planning case is $885.5 \text{ such leads/month} \times 50\% \text{ reached} \times 15 \text{ percentage points of extra bookings among those reached} \times 8\% \text{ conversion per extra booking} \times ₹60,000 = ₹3,18,780 \text{ gross revenue/month}$, before staff and fulfilment costs. Zero or negative net impact is possible.

Why this lever, not the alternatives

Generic reminders are cheap but do not discover or resolve slot friction. Earlier-slot offers address attendance after booking and depend on spare capacity; the observed timing/attendance association is not causal. Post-demo follow-up may have greater revenue potential, but the file lacks parent objections and sales-conversation detail needed to design a focused first intervention. Booking assistance acts directly on the largest observed unbooked group and captures reasons for non-booking.

Biggest adoption risk and response

Stale booking/contact records or unverified teacher slots could cause duplicate outreach or false offers. Make one coordinator responsible for a daily queue; hold incomplete records for manual review, respect opt-outs and a 24-hour contact cooldown, and check the live roster before each offer. Log exclusions, valid slot offers, and staff minutes; pause if data quality or capacity is inadequate.

Measurement and baseline to register

At 24 hours, enroll leads still unbooked with complete contact history and no opt-out; randomize 50/50 to booking assistance or existing process. Keep every assigned lead in the denominator. **Primary:** confirmed demo booking in the CRM within seven days of assignment. **Secondary:** demo joined within 21 days and purchase conversion within 60 days. Watch duplicate contacts, opt-outs/complaints, slot displacement, and coordinator minutes. The first two live weeks establish feasibility, not ROI.

Historical context is $3,229/5,000 = 64.58\%$ with a recorded schedule, but this is an all-lead snapshot, not the eligible 24-hour cohort's seven-day booking rate. The supplied CSV lacks booking-created and contact timestamps. Before outreach, extract a mature recent cohort from the CRM and register its eligible-cohort seven-day booking rate, plus data-completeness and contact baselines; use the concurrent control arm for the causal comparison.

AI disclosure: Kimi and ChatGPT supported earlier exploration; Codex supported data checks, prototype implementation, testing, and memo drafting. Numerical claims were checked against the supplied CSV.
