

Selected lever and alternatives

Selected lever

A daily booking-assistance follow-up for recent leads without a recorded demo booking.

A coordinator reviews the daily list, confirms that the parent still has no booking and that follow-up is appropriate, asks whether they still want a demo, offers two suitable available times, and records the response. Possible results include booked, needs another time, unreachable, and not interested. Calls or messages are delivery channels within this intervention.

Why this lever

The supplied data contains 1,771 leads with no recorded booking out of 5,000 leads across two months. At the case assumption of INR 900 per lead, associated acquisition spending is $1,771 / 2 \times \text{INR } 900 = \text{INR } 7,96,950$ per average acquisition month. This is the largest single drop-off group by allocated acquisition spending, not proven lost revenue or recoverable savings.

Booking assistance directly addresses that stage, gives the coordinator a concrete action, and records obstacles rather than assuming all parents need the same reminder. A small pilot can use existing staff, contact channels, a tracker, and the existing booking system, subject to confirming access, staffing, and suitable slots. It does not require an engineering sprint.

The hypothesis is that some interested parents would book with suitable scheduling assistance. The historical data does not prove this. Staff effort and suitable slot availability are the main operating constraints.

Alternatives not selected for the first pilot

Alternative	Reason to consider it	Reason not to choose it first
Standard booking reminder	Low effort, quick to start, and easy to send to many unbooked leads.	Provides less individual help with selecting a suitable time. The first pilot will test booking assistance and record obstacles, accepting the additional staff effort.
Earlier-slot offers for already-booked parents	Recorded attendance is approximately 75% for demos within two days of lead creation versus 47% for later demos.	Addresses attendance after booking rather than the selected booking gap. It requires spare earlier appointments, and the observed pattern does not establish that rescheduling improves attendance.
Follow-up after a completed demo without a purchase	There are 1,424 such leads, and improved purchase conversion could have substantial revenue potential.	Requires a different sales conversation about purchase objections. This first pilot focuses on getting interested parents to a demo; it does not claim that post-demo follow-up has less financial potential.

Build boundary

The working prototype will demonstrate one component: a simple follow-up tracker. Historical records must not be represented as verified current outreach candidates. Any invented operational examples must be labelled as demonstration data. Recording an outcome must not imply that the tool contacted a parent or changed the booking system.
